Ideathon Pitch Deck

6 SLIDES · KEEP IT SHARP

TEAM NAME	**Yottabyte**
MEMBERS	Atharva Shirke, Stavan Somaiya, Amar Kaushal, Narmit Kumar
CAMPUS	Newton School of Technology
PRODUCT NAME	Satark
TRACK	☑ Track A ☐ Track B

01 · PROBLEM

What's broken?

Describe a real problem, not a feature you want to build. Make the judges feel the pain.

PROBLEM IN ONE LINE

Older adults struggle to verify urgent scam calls because fear and secrecy stop them from checking with someone they trust.

Who faces it, how often?

Older adults are targeted by fake police/CBI calls and pressured to pay immediately. India recorded 24.02 lakh financial-fraud complaints in 2025.

How do they cope today?

Victims may stay on the call, panic, or try to verify alone. Scammers demand secrecy and block a trusted second opinion.

Why does it matter now?

Reported cyber-fraud losses reached ₹22,495 cr in 2025. A digital-arrest scam estimate cited to the Supreme Court was about ₹3,000 cr.

Sources: PIB / Government of India (2025 NCRP figures); LiveLaw, 3 Nov 2025 (digital-arrest estimate).

02 · USER

Building for older adults

Pick one specific user. "Everyone" is not a user.

USER PERSONA	
WHO	Older adults (65+), using WhatsApp/UPI
GOAL	Check suspicious calls/messages fast
PAIN	Threats + secrecy; son lives away
SUCCESS	Knows what to do before paying

How do you know?

Persona hypothesis from the idea deck; not yet validated. Week 3 tests will check comprehension with five older adults.

Where will you find them?

Find older adults through family/caregiver networks and community groups. Invite five participants for short, consented usability tests.

03 · SOLUTION

What are you building?

Show how the user's day changes. A rough sketch or wireframe beats a paragraph.

SOLUTION IN ONE LINE

Satark helps older adults check suspicious messages and calls by explaining scam signals and safe next steps in their language.

STEP 1

Submit a suspicious item

Paste text, upload a screenshot, or share a voice note.

STEP 2

AI explains the signals

OCR / speech-to-text plus multilingual AI highlights authority, urgency, secrecy, and payment pressure.

STEP 3

Choose a safe next step

See risk and uncertainty, plus what to do in your language. Alert family only with permission.

04 · WHY AI

Why does this need AI?

If a simple form or spreadsheet could solve it, rethink. Show what AI makes possible.

THE AI EDGE

Understand context beyond keywords

Combine clues - impersonation, urgency, secrecy, and payment pressure - even when the exact scam script is new.

What goes in, what comes out?

Inputs: pasted text, screenshot, or voice note. Output: risk band, quoted warning signs, uncertainty, and next steps in the user's language.

Which AI tools or models?

OCR extracts screenshot text; speech-to-text transcribes voice notes; a multilingual LLM explains signals and next steps. Known-scam rules add a second signal.

What if the AI gets it wrong?

Show evidence and uncertainty; never mark a message guaranteed safe. Recommend independent verification; share a family alert only with consent.

05 · 3-WEEK BUILD PLAN

How will you ship it?

One clear deliverable per week. Plan for a live product by the end of week 3.

WEEK 1

Text + screenshot triage

Build the web flow for pasted text / uploaded screenshots. Return risk, quoted warning signs, and safe steps.
DONE WHEN: 20 labelled examples tested; correct flags and false alarms logged.

WEEK 2

Marathi / Hindi voice

Add OCR and voice-note transcription. Explain warning signs in plain Marathi/Hindi and provide a spoken response.
DONE WHEN: voice note to spoken answer works end-to-end.

WEEK 3

Trusted-contact alert + test

Add a short family alert only with explicit consent; polish and launch.
DONE WHEN: test with 5 older adults using non-sensitive examples; record comprehension and task completion.
